BEARING TYPES

Cooper bearings are commonly supplied in two forms: the Fixed Type ('GR') and Expansion Type ('EX') as described below. Where conditions are unsuitable for these standard types other configurations are possible.

FIXED TYPE BEARINGS (GR)

The outer race of the fixed (GR) bearing has shoulders integral with the roller track, while the inner race assembly has shoulders formed by hardened lips on the clamping rings or similar integral shoulders.

This type of bearing provides axial location to the rotating portions of machinery and can sustain both radial and axial loading.

The inner race halves are accurately aligned by means of fitted clamping rings.

GR BEARING (D TYPE)

01 and 02 Series through 300mm /12" shaft size and 03 Series through 155mm /6" shaft size.
100 Series all shaft sizes.

GR BEARING (C TYPE)

01 and 02 Series over 300mm /12" shaft size and 03 Series over 155mm /6" shaft size.

EXPANSION TYPE BEARINGS (EX)

The expansion (EX) bearing has a plain outer race roller track. This bearing takes radial load only.

The inner race is clamped to the shaft, and moves

axially with it when expansion or contraction occurs.

The Cooper expansion bearing offers virtually no resistance to axial movement as the rollers spiral through the outer race.

EX BEARING (D TYPE)

01 and 02 Series through 300mm /12" shaft size and 03 Series through 155mm /6" shaft size.
100 Series all shaft sizes.

EX BEARING (C TYPE)

01 and 02 Series over 300mm /12" shaft size and 03 Series over 155mm /6" shaft size.

HOUSING TYPES

Most styles of Cooper housing are available in cast iron, ductile iron or steel. Special types of housing, alternative materials and housings to special dimensions are available on request.

PEDESTALS

Pedestals (also called pillow blocks) are the most common mountings for Cooper bearings. Detail design and number of fixing bolts varies with bearing series and size.

Cooper offer ranges of pedestals that allow direct replacement of SNC, SD, and SAF pillow block units.

LARGE BORE BASE

TWO BOLT BASE

TAKE-UP AND ROD END MOUNTINGS

Take-up units are available as tension type (shown) or push type. Rod-end units are available as shoe type (shown) or tee type.

SELECTION FOR RADIAL LOAD
CALCULATING BEARING LIFE

Selection for radial loading is usually based on the radial load rating denoted by “Cr”. The radial load ratings listed in this catalogue are based on ISO standards. The system establishes a common basis for calculating load ratings for all anti-friction bearings. It is based on the statistical life expectancy for rolling contact fatigue, and provides a reasonable estimate of service life under conditions of adequate lubrication, freedom from contamination and excessive misalignment. In practice, the service life of the bearing may be determined by factors other than the rolling contact fatigue. Generally, the term ‘life’ used in the Bearing Selection section of this catalogue refers to the statistical life of the bearing against rolling contact fatigue as calculated using ISO standards.

Selection for radial load is determined independently from the axial load. Determine the radial load, speed and minimum life required. Generally the shaft size has been predetermined. Selection of the bearing can be made using the following formula:

$$Cr \geq P \times fn \times fL \times fd$$

Where Cr = radial dynamic rating.
P = calculated effective radial load.
fn = speed (rpm) factor.
fL = life (hours) factor.
fd = dynamic or service factor.

$$fn = (rpm \times 0.03)^{0.3}$$

$$fL = (L10 \text{ hours}/500)^{0.3}$$

L10 hours is the expected life in hours of 90% of similar bearings under similar operating conditions.

Note: The product fn x fL should not be less than 1.0.

Alternatively, bearing life may be calculated by the equation $L10 = [Cr/(P \times fd)]^{10/3}$, where:
L10 = expected life of 90% of similar bearings under similar operating conditions, in millions of revolutions.

When the equivalent radial load equals the Cr rating, multiplied by the service factor, the L10 life will be 1 million revolutions.

If high temperatures (above 100°C) are involved, please refer to notes on page7.

Refer to the next page for further notes.

BEARING LIFE REQUIREMENTS

Suggested lives and factors for specific operating conditions are shown below.

Operating conditions	Life factor (fL)	Life hours (L10)
8 hour daily working	3.0-4.0	20,000- 50,000
Continuous operation main drives, large electrical machinery, flywheels, mining	4.4-5.0	70,000-100,000
Continuous operation and an exceptionally high degree of reliability	5.0-6.0	100,000-200,000

We recommend that bearings are specified to provide an L10 life of at least 10,000 hours, except for bearings selected on the basis of static rating.

DYNAMIC FACTOR

The appropriate dynamic factor fd may be taken from the chart below.

Conditions	fd
Steady load or small fluctuations	1.0 - 1.3
Light shock	1.3 - 2.0
Heavy shock, vibration or reciprocation	2.0 - 3.5

LIFE ADJUSTMENT FACTORS FOR CRITICAL APPLICATIONS

The basic L10 life obtained by using the equations or tables in this catalogue are adequate for normal applications.

Bearings for most normal applications are specified using the L10 life as above. For reliability greater than 90%, replace L10 in the above equations with Lna where Lna = a1 x L10 and is given in the table below.

Reliability					
%	95	96	97	98	99
a1	0.62	0.53	0.44	0.33	0.21

MINIMUM RADIAL LOAD

The radial load must exceed a certain value in order to prevent the rollers skidding rather than rolling. Cooper bearings are able to operate at lower loads than other types of rolling element bearings. Minimum radial loads are generally Cr/65 for GR bearings and Cr/120 for EX bearings. Lower loads can be accommodated under certain conditions. Please refer to our technical department.

BASIC STATIC LOAD RATINGS (Cor)

The values of Cor given in this publication have been calculated in accordance with ISO standards. The basic static load rating is defined as that static (radial) load which corresponds to a contact stress of 4,000 MPa (580,000 psi) at the centre of the most heavily loaded roller/raceway contact and produces a permanent deformation of 0.0001 times the roller diameter.

Where rotation is very slow (less than 5 rpm) or intermittent, bearing size can be selected based on the static load carrying capacity. The requisite basic static load rating can be determined from:

Cor = So x P
where:
Cor = basic static radial load rating (kN)
P = effective bearing load (kN)
So = static safety factor

Bearing Static Safety Factors, so

Type of operation	Requirements for smooth running		
	Low	Normal	High
Vibration free	1	1.5	3
Normal	1	2	3.5
High shock loads	2.5	3	4

SELECTION FOR AXIAL LOAD

Selection for axial load is considered independently from the radial load. Determine the axial load applied to the bearing. Knowing the speed and desired shaft size, select a bearing using the following formula:

Ca > (fda x fdn x Pa) / fb
Where:
Ca = axial rating | fda = dynamic or service factor
Pa = calculated axial load
fdn = Velocity (dn) factor (See scale opposite)
fb = bearing factor (see scale opposite)

The dynamic or service factor fda may be 1 for peak overload periods and 1.1 to 1.2 for general running (depending on smoothness), where the load is accurately known. An allowance for any inaccuracies in the calculated loads must be made to ensure that the bearing axial capacity is not exceeded.

Retaining rings or recessed journals are required when Pa > 0.5Ca for 01, 02 and 03 Series, if Pa > 0.25Ca for 01E and 02E Series bearings, and if Pa > 0.2Ca for 100 Series bearings. Refer to our technical department.

If the axial load exceeds 40% of the radial load, please consult our technical department. The axial load capacity is decreased by 50% if the lubricant does not have extreme pressure (EP) additives.

TEMPERATURE AND BEARING CLEARANCE

The normal temperature range for standard bearings is 0°C to 100°C. For temperatures outside this range, our technical department should be consulted as special attention may be required to materials, seals and lubrication.

The standard bearing clearance is usually suitable for temperatures up to 100°C provided that the difference between shaft and housing temperatures is not more than 40°C. For higher temperatures or greater temperature differentials, bearings of C3 or C5 clearance are offered.

Reduced (C2) clearance bearings are offered where appropriate (e.g. for reciprocating or vibratory applications).

Bearing dynamic capacity is decreased by increased clearance or operation over 150°C

Velocity factor fdn applies only to axial loads on GR bearings.
dn (mm) = bearing bore (mm) x shaft speed (rpm)
* refer to technical department

SHAFT TOLERANCE

Journal diameter tolerance is generally h7. For speeds over 150,000mm dn and all C2 clearance bearings the tolerance is h6. For light loads and slow speeds wider tolerances up to h9 may be permissible. Please consult our technical department if a wider tolerance is required, or if it is required to mount a bearing on an existing shaft with a different tolerance to those specified above.

Where the shaft is stepped so that the diameter of the shaft at the seals is different to the journal diameter, a wider tolerance (h9) is permissible for the shaft diameter at the seals. The table below shows relevant tolerances for shaft diameters up to 600mm. The maximum surface roughness of the journal should not exceed 3.2µm Ra when diameter tolerance h7 applies, or 1.6µm Ra when tolerance h6 applies. The maximum surface roughness of the portion of the shaft under the seals is specified on pages 10 and 11.

TOLERANCES OF SHAFT DIAMETERS

Diameter (mm)	Over	-	50	80	120	180	250	315	400	500
	Up to and including	50	80	120	180	250	315	400	500	630

SEALING SOLUTIONS

Efficient performance and long life of the roller bearing depend to a large extent upon the exclusion of foreign matter from the internal bearing surfaces. Grease, or oil, serves the dual purpose of lubricating these surfaces and protecting them from corrosion. Thus the seal must prevent dust, grit and moisture from entering the bearing and at the same time prevent grease or oil from escaping.

ALIGNMENT FEATURE

Cooper supplies various mounting options and for all, except the hanger mountings, the bearing is housed in a cartridge supported by the mounting unit. Cartridges have a spherical outer surface that fits into a conforming surface in the mounting unit (such as pedestal or flange) in the manner of a ball and socket joint.

Any shaft misalignment that may exist tends to move the cartridge, seal and bearing together, maintaining the seal on an axis parallel to the shaft. Standard pedestals and flanges are designed to allow up to 2½° misalignment between the shaft and housing, under constant or slowly changing alignment conditions, without compromising sealing.

Compare this with the situation that occurs with a double row spherical bearing in a standard pedestal. If the pedestal is not accurately aligned with the shaft, contact between the seal and the shaft tends to be lost at one side, and the seal presses more heavily against the shaft at the other. In the worst case a gap may open, compromising the sealing, or the seal may bind on the shaft. Although felt seals are shown in the illustration, a similar situation occurs with labyrinth or lip seals.

SEAL TYPES

Cartridges for shaft sizes up to 300mm/12" are usually supplied with a general purpose felt seal. The felt groove will also accommodate high temperature packing seals, lipped seals or suitable blanking plates. Triple labyrinth seals are often supplied as an alternative and are precision non-rubbing seals capable of high speed operation. Due to the aligning feature described above, extremely close tolerances can be maintained between the housing and the shaft. The result is an effective sealing element which is one of the best in the anti-friction bearing industry.

Cartridges for shaft sizes over 300mm/12" are supplied with grease groove seals as standard. Cooper offer a wide range of sealing options, the more common of which are illustrated overleaf. For special applications seals may be made from other materials and alternative special seals can be supplied to suit specific conditions.

**FELT (F)**

Standard in UK and Europe

Temperature limits -70°C to 100°C
 Maximum speed 150000 dn(mm)
 Shaft surface finish 1.6 µm Ra max.

**HIGH TEMPERATURE PACKING (HTP)**

A direct replacement for felt in high temperature applications.

Temperature limits -70°C to 260°C
 Maximum speed 150000 dn(mm)
 Shaft surface finish 0.8 µm Ra max.

**ALUMINUM TRIPLE LABYRINTH (ATL)**

High temperature version (ATL HT)
Low temperature version (ATL LT)

Machined aluminium bodied triple labyrinth seal for high speed and general applications. ATL supplied as standard sealing arrangement in USA and Canada. ATL HT and ATL LT are fitted with O rings of different materials.

Temperature limits ATL -20°C to 100°C
 ATL HT -20°C to 175°C
 ATL LT -60°C to 100°C

Maximum speed Bearing maximum
 Shaft surface finish 3.2 µm Ra max.

**GREASE GROOVE (LAB)**

Suitable for high or slow speed operations. Particularly successful on marine applications.

Temperature limits Bearing maximum
 Maximum speed Bearing maximum
 Shaft surface finish 3.2 µm Ra max.

**SYNTHETIC RUBBER SINGLE LIP (SRS)**

High temperature version (SRS HT)
Low temperature version (SRS LT)

Suitable for wet but not submerged conditions. Can be used for improved lubricant retention by mounting lip inwards.

Temperature limits -70°C to 260°C
 Maximum speed 150000 dn(mm)
 Shaft surface finish 0.8 µm Ra max.

**SPRING-LOADED SINGLE LIP WITH RETAINING PLATE (SRSRP)**

High pressure version (SRSRP 40M)

Suitable for severe splash or completely submerged conditions. The standard version is suitable for up to 2m of water: the high pressure version is suitable for up to 40m of water.

Temperature limits -20°C to 100°C
 Maximum speed 150000 dn(mm)
 Shaft surface finish 0.4 µm Ra max.

BULKHEAD SEALING

It is often found economical to combine a bearing and bulkhead seal into one unit. This reduces the number of individual units required, and prevents problems with shaft eccentricity sometimes encountered at the bulkhead seal when it is separated from the bearing.

Generally, a specially adapted flange mounting is used and the bearing is fitted with SRSRP seals.

Generally, the flange incorporates additional sealing to the cartridge seating, and may include sealing on the mounting face ('backface').

Where the shaft surface speed is too high for standard SRSRP seals, an alternative high speed version is available, or alternative seal types can be used if a moderate leakage of water is permitted through the bearing in an emergency.

BLANKING PLATES

Where shafts terminate at the bearings, ‘blanking plates’ may be used to close off the cartridge ends. Blanking plates are available to suit standard single groove and TL cartridges.

On sizes up to 90mm/3½” blanking plates accommodating thrust bearings can be used for axial location of shafts.

A typical application is on the shafts of belt conveyors.

For blanking plates with thrust bearings, the shaft ends must be machined smooth and square. Upon assembly, there must be slight clearance between the shaft ends and the thrust bearings (i.e. slight end float), without the possibility of preload. Blanking plates with thrust bearings are limited to a maximum speed of 20,000mm dn (calculated using the shaft size, not the bore of the thrust bearing) and to shaft location only (i.e. only nominal axial loading).

01

BT

90M

Series of bearing and cartridge to which blanking plate is to be fitted (i.e. 100, 01, 02 or 03)

BP for blanking plate without thrust bearing
BT for blanking plate with thrust bearing

Size reference: _____
For metric sizes this is the bore size in mm followed by 'M', e.g.:
90M = 90mm
For inch sizes the first digit(s) indicate whole number of inches and the last two digits indicate sixteenths of an inch, e.g.:
307 = 3-7/16"
1200 = 12"

01

BTTL

02

Series of bearing and cartridge to which blanking plate is to be fitted (i.e. 100, 01, 02 or 03)

BPTL for blanking plate without thrust bearing
BTTL for blanking plate with thrust bearing

Size reference: _____
Use the last two digits of the cartridge reference, e.g. if the cartridge reference is 01 C 02, the digits to be put here are 02 as shown

ORDERING

For blanking plates to suit single groove cartridges, the part code is made up as follows:

For blanking plates to suit TL cartridges, the part code is made up as follows:

BT and BTTL blanking plates are only regarded as

standard items for 01 and 02 series cartridges up to 90mm/3½” bore size.

For all blanking plates, if the cartridge end bore is machined to suit a shaft diameter that is different to the bore of the bearing, refer to Cooper for the relevant part code.

DIMENSIONS

Dimensions for shaft terminations, when using blanking plates with thrust bearings, are shown below:

Shaft diameter d		01 Series		02 Series	
		K	t	K	t
35mm	1 3/16"	27	2	-	-
40mm	1 1/4" 1 7/16" 1 1/2"				
45mm	1 11/16" 1 3/4"	29	1	-	-
50mm	1 15/16" 2"	29	1	35	1
55mm		30	2	-	-
60mm	2 3/16" 2 1/4"	30	2	38	2
65mm	2 7/16" 2 1/2"				
70mm	2 11/16" 2 3/4"	35	4	41	0
75mm	2 15/16" 3"				
80mm	3 3/16" 3 1/4"	40	4	48	3
85mm	3 1/2"				
90mm					

INSTALLATION AND ASSEMBLY

The following is a typical assembly sequence of a pedestal or flange mounted bearing and is included to allow engineers using this catalogue to understand the assembly process of the Cooper bearing and to allow them to produce relevant documentation for their own machines, which may require this information. A full set of assembly instructions is usually packaged with each standard bearing, for use by the fitters. If non-standard bearings are to be used, and/or a different assembly sequence is required for the application, specific assembly instructions can be supplied on request.

The illustrations use a pedestal mounted unit as an example.

PRELIMINARY NOTES

Bearings must be disassembled before assembling into position.

Unwrap the bearing parts, remove the outer race halves (if supplied assembled around other parts), and separate the halves of the cage (if required). Various cage jointing methods are used depending on size and series of bearing. Undo the clamping ring screws and remove the clamping rings from the inner race.

Remove the preservative from all surfaces of all the parts.

All bearing and housing components (with the exception of pressed steel, die cast and plastic cages) are marked with matching numbers or letters on each half. Ensure that the match marks on the halves are the same and are placed together on each component when the bearing is assembled.

Even though cage halves are not necessarily match-marked, they must not be mixed, as the rollers are graded into sets.

Complete roller bearings are interchangeable between similar Cooper cartridges. Individual parts should not be interchanged. Cartridges are interchangeable between standard outer housings provided that standard clearances are specified.

STEP 1 – HOUSING BASE

Place the pedestal base or flange lower half into position. If the precise location of the housing is predetermined it may be bolted into position. Generally, pedestal bases may require slight movement at a later stage in order to accurately position the shaft.

Note: The pedestal base is not shown in most of the illustrations that follow, for clarity of other details.

STEP 2 – INNER RACE

Lightly oil the shaft with thin machine oil, then remove the excess with a clean wiper. Place the inner race at the correct position on the cleaned shaft. Soft packing on the joint faces, or feeler gauges, should be used to ensure that the joint gaps are approximately equal. Inner races of expansion bearings are usually set centrally with the outer race, but in cases of significant axial expansion there may be a deliberate offset. (This is usually up to a maximum of 10% of the roller length, but may be more in the case of special types of bearing).

STEP 3 – CLAMPING RINGS

Fit the clamping rings with joints at approximately 90° to the inner race joints (45° in the case of large bearings with 4-part clamping rings). Progressively tighten all clamping ring screws.

Tap down each half of the inner race and clamping rings all around the shaft using a soft-faced hammer, or insert a hardwood block between a steel hammer and the bearing parts. Retighten the clamping ring screws. Repeat until screws remain fully tight.

Check that there are approximately equal gaps at both joints of the inner race.

Check that there are approximately equal joints at both (or all 4) joints of each clamping ring.

STEP 4 – CAGE AND ROLLERS

Coat the bore of the cage and roller assembly with grease and lightly cover the inner race assembly (fitted to the shaft) all over with grease for protection.

Assemble the cage (complete with rollers) around the inner race. The two halves of the cage are fixed together by various means depending on size and series of bearing. (Further details are to be found in the assembly leaflets supplied with the bearing, or details of the joint of a particular size and series of cage can be supplied on request).

STEP 5 – CARTRIDGE AND OUTER RACE SUB-ASSEMBLY

Place the half outer race with the lubrication hole in the top half of the cartridge and the second half outer race into the lower half of the cartridge. Ensure that the ends of the outer race project from the cartridge joint face by equal amounts. All lipped outer races must be clamped axially. Side screws 'A' are fitted to all GR cartridges. Side rods 'B' are fitted to some sizes only.

Radial screws 'C' and washers are fitted to both EX and GR cartridges of larger sizes only.

EX CARTRIDGES:

Just enter radial screws 'C' (where fitted, complete with washers) into the corresponding outer race holes, but do not tighten. Place the two half cartridges together, complete with half outer races, and fully tighten the joint screws 'D'. Fully tighten the radial screws 'C'.

CARTRIDGES FOR LIPPED OUTER RACES (GR AND SPECIAL TYPES):

Just enter radial screws 'C' (where fitted, complete with washers) into the corresponding outer race holes, but do not tighten. Place the two half cartridges together, complete with outer races, and fully tighten the joint screws 'D'. Enter the side rods 'B' (where fitted) and side screws 'A'. Progressively and fully tighten the side screws 'A' and radial screws 'C' (where fitted).

ALL TYPES:

Inject grease to fill the grease passages. Remove joint screws 'D' and separate cartridge halves, taking care that the outer race halves do not fall out of position in their respective half-cartridges.

STEP 6 – SEALS

If the unit is to be fitted with aluminium triple labyrinth (ATL) seals, fit them onto the shaft as follows:

Separate the ATL seal halves by driving out the two jointing pins. Lubricate the 'O' rings in the bore with grease. Reassemble on the shaft by compressing the 'O' rings of both halves sufficiently to allow the jointing pins to be reinserted, and reinsert the pins. Note: ATL seals are able to slide along the shaft once assembled

Felt seals should be soaked in oil before fitting into the cartridge end bores. Most types of seal other than triple labyrinth seals and SRSRP seals are fitted into the cartridge end bores before assembling the cartridge into position.

STEP 7 – LUBRICATION

Coat the inside of the cartridge, cage and rollers and all seals with grease (See page 18 for correct quantity). For speeds over 150,000mm dn (shaft diameter in mm multiplied by shaft speed in rpm) approximately 40% of the grease used should be applied to the bearing parts and the remainder applied to the inside of the cartridge. This is to avoid excessive churning of grease when running at high speed.

STEP 8 – CARTRIDGE

Lubricate the spherical seating of the bottom half of the cartridge with grease.

Place the bottom half of the cartridge on top of the bearing and rotate 180° into the pedestal base or half-flange.

Place the top half of the cartridge on top of the bottom half, close the cartridge and fully tighten the joint screws. Lubricate the spherical seating with grease.

STEP 9 – HOUSING

If not already done, tighten the bolts fixing the pedestal base or lower flange half into position. Place the pedestal cap or flange top half into position. If it is safe to do so, running the shaft for a time without the outer housing joint screws fully tightened will help the bearing to accurately align. Fully tighten the joint screws.

GREASE QUANTITIES
FOR INITIAL LUBRICATION

The quantity of grease required on initial assembly is dependent upon operating speed and temperature.

If the operating temperature is below 80°C the quantity of grease may be determined directly according to bearing reference and operating speed from the following table.

If the operating temperature is above 80°C, a 25% pack of grease should be used regardless of speed (refer to the right hand column of the table). With a ‘full pack’ of grease the space within the cartridge (i.e. surrounding the bearing components) in the assembled unit is completely filled with grease.

The table assumes normal density grease (about 0.85g/cm3).

100 SERIES

Group Reference	Speed (rpm) up to	Grease (full pack) (kg)	Speed (rpm) from	to	Grease (75% full pack) (kg)	Speed (rpm) from	to	Grease (50% full pack) (kg)	Speed (rpm) from	to	Grease (33% full pack) (kg)	Speed (rpm) over	Grease (25% full pack) (kg)

PEDESTALS

Pedestals (also known as Pillow Blocks) are the most common method of mounting Cooper split roller bearings (in cartridges as explained above).

Cooper standard pedestals are shown on the following pages. Pedestals with height-to-centre and bolt hole configurations to match industry standard SN, SD and SAF pillow blocks are listed separately in this catalogue.

Pedestals are common between expansion (EX) and fixed (GR) units.

LOADS AND MOUNTING

The maximum safe radial load for a pedestal is based on the static rating (Cor) of the corresponding size of roller bearing. The full static rating can be applied if the angle of the load falls within the shaded area of the sketch.

If the radial load falls outside the shaded area, if the radial load exceeds Cor, or if the axial loads exceed 50% of the axial rating (Ca) of the

corresponding roller bearing please consult our technical department. For 100 Series bearings, the maximum axial load is reduced to 35% Ca and for 01E and 02E series to 26% Ca due to their higher axial load ratings.

Pedestals should be fully supported on a flat, rigid surface to avoid distortion of the pedestal or deflection under load.

For loads within 45° of horizontal, the base should be chocked or dowelled.

Standard Cooper pedestals are manufactured from grade EN-GJL-250 grey iron to BS EN 1561 : 1997. Ductile iron and steel pedestals are also available and should be considered for shock or pulsating loads. Particulars of pedestals in alternative materials are available from our technical department.

- 1) Add 'EX' or 'GR' to reference for expansion or fixed type respectively, e.g. Bearing: 01 B 35M EX or 01 B 103 EX
Cartridge: 01 C 35M EX or 01 C 01 EX
- 2) Total movement tabulated. Maximum offset from centreline half this amount

* Add 'OTL' to reference for cartridge for ATL seals if the cartridge for felt seals with the same bore size is also marked*, eg 01 C 10 OTL.

1) Add 'EX' or 'GR' to reference for expansion or fixed type respectively, e.g: **Bearing:** 02 B 50M EX or 02 B 115 EX
Cartridge: 02 C 50M EX or 02 C 03 EX

2) Total movement tabulated. Maximum offset from centre line half this amount.

1) Add 'EX' or 'GR' to reference for expansion or fixed type respectively, e.g. **Bearing:** 02 B 140M EX or 02 B 503 EX
Cartridge: 02 C 140M EX or 02 C 30 EX

* Add 'OTL' to reference for cartridge for ATL seals if the cartridge for felt seals with the same bore size is also marked*, eg 02 C 31 OTL

2) Total movement tabulated. Maximum offset from centreline half this amount.

1) Add 'EX' or 'GR' to reference for expansion or fixed type respectively, e.g. Bearing: 03 B 280M EX or 03 B 1100 EX
Cartridge: 03 C 280M EX or 03 C 83 EX

2) Total movement tabulated. Maximum offset from centreline half this amount.

COOPER ‘COMPATIBLE’ PEDESTALS

Cooper SNC500, SDC3100 and SAF500 Series pedestals are designed for use where interchangeability with SN500, SD3100 and SAF500 series pillow block units is required. They may be used to economically replace existing solid bearings, or may be incorporated into new machinery where the envelope dimensions of these units are desirable.

Generally, the bearings and cartridges are standard 01, 01E, 02 or 02E Series units. In some cases cartridges and bearings of reduced outside diameter are used in order to provide adequate pedestal base thickness. However, the load ratings of the standard bearings of the same bore size still apply.

The Cooper pedestals have bolt hole spacings and heights to centres corresponding to the equivalent industry standard units for solid bearings. However, the footprint, overall pedestal height and length on shaft may differ and should be checked against available space.

The tables on the following pages list the Cooper pedestals with the bearing and cartridge of the same bore size as the shaft diameter that is commonly accommodated in the equivalent pillow block with a solid bearing mounted on an adaptor sleeve. These pedestals may also be used with alternative sizes of Cooper bearing. Bearings and cartridges of the same group size (as tabulated in the main bearing, cartridge and pedestal pages) may be accommodated in the same pedestal. In many cases, bearings and cartridges of different series may also be accommodated in these pedestals, providing an even wider choice of bore sizes where the pedestal dimensions are appropriate and loading conditions permit.

SNC500 pedestals are manufactured from grade EN-GJL-250 grey iron to BS EN 1561 : 1997 as standard. SAF500 and SDC3100 pedestals are manufactured from grade EN-GJS-400/18 ductile iron to BS EN 1563 : 1997 as standard.

1) For full references of bearings and cartridges see pages 30 to 36

2) Applies for cartridges with either single seal groove or TL seals

*Pedestals equivalent to these sizes are also available in the Cooper SSNC500 range. Cooper SSNC500 pedestals have the same height to centre as the SNC500 range but do not have slots for the holding-down bolts. They may be drilled by the user for either 2 or 4 bolts. The SSNC500 pedestals are manufactured from ductile iron. Please consult Cooper for full dimensional and loading data.

- 1) For full references of bearings and cartridges see pages 30 and 36 to 38
 2) Applies for cartridges with either single seal groove or TL seals
 3) Special bearing and cartridge required for this size. Bearing ratings are as for standard 02 B 415, but outside diameters of bearing and cartridge differ from standard.

References: Fixed-type bearing: 02 B 415 GR 16
 Expansion-type bearing: 02 B 415 EX 16
 Fixed-type cartridge (for TL seals): 02 C 10 GR 21
 Expansion-type cartridge (for TL seals): 02 C 10 EX 21

FLANGES

Flanges provide a simple means of mounting Cooper split roller bearings against a vertical or horizontal face or bulkhead.

The most common types of flange are the round flange as shown on pages 51 to 55 and the more compact square flange as shown on page 56. Standard round flanges and square flanges are made from grey iron and ductile iron respectively. Alternative materials and designs are available.

Flanges are common between expansion (EX) and fixed (GR) units.

Maximum radial loads for standard units are 26% of static rating (Cor) when used with 01 or 02

Series bearings, and 20% of static rating when used with 01E, 02E and 100 Series bearings. Maximum axial loads are 25% of the axial rating (Ca) of 01 or 02 Series bearings, 18% for 100 Series and 13% for 01E or 02E Series bearings. These loadings can be exceeded considerably with modified construction or materials, and depending on loading direction.

The bulkhead or support plate on which the flange is mounted must be of adequate strength and rigidity to support the imposed load with little distortion of the flange mounting area. Square flanges are more appropriate for steel frames or skid mounted units.

ROUND FLANGE

FLAT FLANGE

SQUARE (DF) FLANGE

1) For full references of bearings and cartridges see pages 28 and 30

2) Applies for cartridges with either single seal groove or TL seals

3) Dimension applies to backface of flange. Joint bosses project beyond footprint of backface. Width over joint bosses: 255mm

HANGERS

Hanger units are a compact means of supporting the shafts of screw conveyors and similar equipment.

The 100 Series units offer the lowest housing frontal area for a given shaft diameter.

The bearing is mounted directly into a split grey iron housing ('hanger') with a threaded boss, to allow suspension from the conveyor cross-bracing. A swivel fixing at the cross-bracing joint is recommended to provide for alignment of the bearing.

Hangers are only suitable for housing expansion ('EX') type bearings.

Double felt seals are supplied as standard. The standard seal grooves are also able to accommodate rubber lip seals or high temperature packing. A tapped hole in communication with the space between the seal grooves at each end of the housing is optionally provided. This is for connection to either a grease supply or an air supply for regular or continuous purging of the seals.

Another option is for the housing end bores to be machined to take heavy duty lip seals as illustrated below. The length on shaft of these units may be slightly greater than standard; details will be supplied on request.

It is recommended that our technical department is contacted in order to obtain a recommendation for the sealing of each hanger unit application.

Lubrication points are not fitted to hangers as standard, with provision for lubrication of the bearing usually made through the suspension rod. Continuous grease feed is sometimes desirable.

STANDARD HANGER**HANGER WITH HEAVY DUTY LIP SEALS**

The standard type of hanger has a single threaded boss for suspension from above, by a single rod to minimise the obstruction to material flow in scroll conveyors. For applications where it is desired to locate the housing by rods from above and below, a double boss type is available.

DOUBLEBOSSHANGER

TRIPLEBOSSHANGER

A further type of hanger has three threaded bosses disposed at 120 degree intervals for location by three rods.

COOPER® THE ORIGINAL SPLIT ROLLER BEARING

The inventor of the split to the shaft roller bearing, Cooper has unrivalled expertise gained in over 100 years manufacturing both the bearing and the housing at their site in King's Lynn (UK)

HIGHESTCAPACITY

Cooper's position as a leader in the field has been recently re-affirmed with the introduction of the O1E/O2E series. Equipped with a robust brass cage and larger rollers the new series ensures significant improvements in radial and axial capacity confirming Cooper as the highest capacity split bearing on the market.

WIDESTRANGE

With 4 series of split cylindrical roller bearings: 100 (light), 01 (medium), 02 (heavy) and 03 (extra heavy) as well as a range of split taper roller bearings, Cooper has a range unmatched by any manufacturer.

1) For grease / air purge points to seals add 'AP' to reference, e.g.: 01 H 125M AP For double boss type add 'DOUBLE BOSS' to reference, e.g.: 01 H 125M AP For double boss type with purge points to seals add 'DOUBLE BOSS AP' to reference, e.g.: 01 H 125M DOUBLE BOSS AP

2) Hangers with metric bore sizes have metric mounting threads as standard. Hangers with inch-size bore sizes have UNC mounting threads as standard.
3) Mass of single boss version. Double boss version slightly heavier.

I) Hangers with metric bore sizes have metric mounting threads as standard.
Hangers with inch-size bore sizes have UNC mounting threads as standard.

TAKE-UP UNITS

Cooper Take-up units are an efficient means of tensioning the pulleys of conveyors and elevators.

Each take-up unit consists of a Cooper split roller bearing in a swivel cartridge mounted in a cast iron sliding unit. Two basic configurations are available – the 'push' type and 'tension' type as illustrated.

Usually a Cooper take-up will be mounted at each end of the shaft. Up to and including

90mm/3½" bore size the standard arrangement uses two expansion (EX) bearings, with axial location provided by blanking plates and ball thrust bearings. Above 90mm/3½" bore size the standard arrangement uses two fixed (GR) bearings and plain blanking plates. If a through-shaft or different method of axial location is required, please consult our technical department.

PUSH TYPE

Up to 90mm arrangement

PUSH TYPE

Over 90mm arrangement

TENSION TYPE

Up to 90mm arrangement

TENSION TYPE

Over 90mm arrangement

1) For radial bearing only reference (for standard arrangement)
add 'GR' e.g. 02 B 100M GR
For cartridge reference refer to pages 36 and 38

ROD ENDS

Cooper split roller bearings in rod end housings provide a simple way of mounting roller bearings on cranks. As the complete bearing and housing unit is split radially, cranks can be made solid rather than being built-up or overhung. Typical applications include shaker screens and classifiers. Rod ends are available to suit 100, 01/01E and 02 Series bearings as shown on pages 28 to 30 and 36 to 38.

Each rod end consists of a split outer casing, which encloses a fixed (GR) bearing in a swivel cartridge. Two basic configurations are available – the 'T' type and the 'shoe' type. These can be modified to suit various rods and attachments.

Standard rod ends are of grey iron. Spheroidal graphite iron or steel versions are available. Rod ends are supplied with matched cartridge to

reduce the clearance between the cartridge and rod-end (S1 fit).

Except for very slow speed applications, bearings with C2 clearance should be specified. Dimensions and load capacities of housings should be confirmed before finalising designs.

SHAFT DIMENSIONS

Journals should be machined to h6 tolerance. Close tolerance machining to the sides of the journal is not required. These are clearance only (i.e. not locating) as the bearing is positioned by the inner race being clamped onto the shaft. The journal widths and fillet radii listed in the tables are suggested dimensions to clear standard Cooper cartridges. Other combinations of journal width and fillet radius may be used. Special cartridges may be supplied if narrower journals are required.

SPLIT TAPERED BEARINGS INTRODUCTION

The Cooper split tapered bearing is intended for the 'fixed' bearing position of shafts where there is both radial and axial loading and our 'GR' type cylindrical bearing is unsuitable. It is constructed with two rows of opposed rollers to take axial loading in either direction.

Cooper split tapered roller bearings are usually mounted in a cartridge in a similar way to Cooper cylindrical bearings. Cartridges for tapered bearings are machined with grease groove seals as standard and provision made for a temperature element. Alternative seal types are available as page 10 and 11, and flange-mounted units may be supplied with bulkhead

sealing arrangements. The proximity of the temperature element hole to the shaft means that if it is of a headed type, generally it will have to have a cranked probe. Alternative positions for the temperature element are possible.

The cartridge is mounted by its spherical seat in an outer housing. Various housing types are available, as for cylindrical bearings, but the most common types are the pedestal and flange. Cooper technical department should be consulted to confirm housing strength against the anticipated loads before finalising selection. Ductile iron housings are generally used with these bearings, as indicated by the part numbers listed on the following pages.

BEARING SELECTION

Bearing ratings for dynamic radial capacity (C_r) and static radial capacity (C_{or}) shown in this leaflet are in accordance with ISO 281-1990 and ISO 76-1987 respectively.

Radial and axial loads must be considered together as combined 'equivalent loads', as explained below. Generally, maximum instantaneous loading is governed by housing strength rather than bearing static capacity.

Dynamic rating

Expected bearing life is calculated by the following equation:

$$L_{10} = [C_r / (P \times f_d)]^{(10/3)}$$

where:

L_{10} = expected life of 90% of similar bearings under similar operating conditions

C_r = radial dynamic rating

P = equivalent dynamic load

f_d = dynamic or service factor, generally from 1 for steady loading to 3.5 for heavy shock, reciprocation or vibration

The dynamic equivalent load is calculated as follows:

$$\text{when } F_a / F_r \leq e : P = F_r + Y_1 F_a$$

$$\text{when } F_a / F_r > e : P = 0.67 F_r + Y_2 F_a$$

where:

F_r = applied radial load

F_a = applied axial load

and calculation factors Y_1 , Y_2 and e are given in the product data tables.

Life calculation with multiple load conditions

Where varying loads are experienced in operation, using the maximum load condition may lead to an unrealistically low calculated life. For n load conditions constituting the full load cycle (at constant speed), an overall dynamic equivalent load may be calculated as follows:

$$P = \left[\sum_{i=1}^{i=n} P_i^{(10/3)} p_i \right]^{0.3}$$

where:

P_i = dynamic equivalent load under load condition i

p_i = proportion of time load condition i is applicable

Where the load is continuously variable it may be broken down into a discrete approximation to the actual load cycle.

Minimum loading

In order to avoid excessive skidding of the rollers, sufficient loading must be applied to the bearing, as follows:

$$P \geq 0.01 C_r$$

ASSEMBLY

The assembly procedure for a Cooper split tapered roller bearing unit is substantially similar to that of a cylindrical bearing and housing. However, some additional points need to be

drawn to the attention of the fitter and a full set of assembly instructions for split tapered bearings should be referred to before commencing installation. This may be obtained in electronic form from Cooper technical department.

GREASE QUANTITY FOR INITIAL LUBRICATION

The quantity of grease required on initial lubrication is dependent upon operating speed and temperature.

should be used regardless of operating speed (refer to the right hand column of the table).

With a 'full pack' of grease the space within the housing (i.e. surrounding the bearing components) in the assembled unit is completely filled with grease.

The table assumes normal density grease (about 0.85 g/cm3).

INITIAL LUBRICANT QUANTITIES

ROUTINE GREASING

Relubricate the bearing weekly or every 150 hours of operation. Sizes up to and including 120mm: Use 2ml of fresh grease. Sizes over 120mm: Use 4ml of fresh grease. Note that 2ml is approximately 1 shot from a conventional side-lever grease gun. Automatic lubrication systems should be metered to deliver grease at an

average rate equivalent to the routine greasing periods and quantities specified. If it can be done safely, the bearing should be re-greased as it rotates to help distribute the grease. Do not mix different types of grease in the bearing. Excessive quantities of lubricant should not be used, particularly at high speeds, as this may result in excessive churning and overheating.

TIGHTENING TORQUES

The tightening torques for the assembly of the bearings and housing are given in the following table. All screws are metric coarse thread, grade

12.9. Full assembly instructions are provided with each order, and are available separately if required.

- 1) Dimension shown is as-cast dimension. Depending upon manufacturing method used, flanges supplied may be machined 5mm smaller
- 2) Dimensions shown are for locating spigot for mounting flange on to. Diameter tolerance of locating spigot: f8
Where SRSRP seals are used cartridge assembly may protrude into bulkhead. Consult Cooper for minimum bulkhead aperture size.

LARGE BORE BEARINGS

The following table lists some of the bearings over 600mm/24" bore size manufactured by Cooper recently.

This table may be used as a guide for selecting or designing-in large bore bearings, but it should be borne in mind that these larger sizes of bearing are frequently adapted to meet application requirements. They may be modified to match existing or required envelopes and capacities. Many of the bearings may be supplied with slightly different bore sizes to those under which they are listed, while alternative versions may already be available at some bore sizes without modification.

Generally, these bearing are available in expansion 'EX' or fixed 'GR' types (see page 3). Extra-expansion 'EXILOG' types are also made regularly, but often have different envelope dimensions (in particular; the inner race is usually wider).

Lighter duty 04 Series bearings are shown separately on page 92. It is always advisable to contact Cooper when specifying large bearings.

HOUSINGS

If the bearing is to be mounted in a housing made by the equipment manufacturer, Cooper will supply details of the required mounting tolerances upon request.

If the bearing is to be fitted into an existing housing, accurate details of the mounting dimensions should be supplied to Cooper to ensure compatibility.

Cooper can supply suitable housings, including cartridges, pedestals, flanges, and custom housings for large bearings. (See other sections for explanations of these housing types). Please contact Cooper with application details so that we can supply details of the most suitable housing, or design or adapt a housing to suit if required.

DOUBLE BEARINGS

Large bearings are often paired to form a 'double bearing' of increased capacity.

To calculate the dynamic capacity of a double bearing, multiply the dynamic capacity (C_r) of the single bearing by 1.714.

To calculate the static capacity of the double bearing, multiply the static capacity (C_{or}) of the single bearing by 2.

Mountings for double bearings should be designed to equalise the loading on the two rows of rollers.

Bearings should only be mounted together to form a two-row bearing if they are supplied by Cooper specifically for this purpose, and the bearings should be maintained in their allocated pairings.

LARGE BEARINGS

Shaft Diameter d	Reference	D (mm)	C (mm)	B (mm)	C_r (kN)	C_{or} (kN)

1250mm	03 B 1250M	1630	350	214	8587	21001

1) Dimensions of 03E B 613.2mm refer to EXILOG type with roller axial guide surfaces to outer race only

2) These capacities are achieved with a special type of cage and roller assembly.

04 SERIES BEARINGS

Cooper 04 Series bearings are specialised bearings for lighter duties at large bore sizes.

04 Series bearings are capable of high speeds, but are also used on lower speed applications. Use of these bearings at high speeds requires special attention to lubrication.

If the bearing is to be used at slow speeds only it may be possible to omit some of the 'high speed' features of the bearing, allowing a more economical bearing specification.

Generally, these bearing are available in expansion 'EX' or fixed 'GR' types (see page 3). Alternative configurations are possible where appropriate. These bearings may be subjected to a degree of adaption to suit application requirements. They may also be supplied with slightly different bore sizes to those under which they are listed.

It is advisable to contact Cooper when specifying 04 Series bearings.

HOUSINGS

Most commonly, 04 Series bearings are mounted in customer's own housings or into housings integrated into the structure of the machine. Details of appropriate mounting tolerances can be supplied on request.

If it is wished for Cooper to supply bearings complete with housings, please contact us with application details.

In general, if operating conditions and envelope restrictions allow, it is more economical to supply 01 Series bearings complete with housings, as a greater range of standardised housings is available for the 01 Series.

Shaft Diameter d (mm) (inches)	Reference	D (mm)	C (mm)	B (mm)	Cr (kN)	Cor (kN)	Max. Speed (rpm)	Mass (kg)

WHAT TO DO WITH YOUR USED BEARING

RECONDITIONING

Cooper offer a reconditioning service for larger bearings. A used bearing is thoroughly cleaned and a detailed report prepared on its condition and the work required to bring it back to an as-new functional condition. Generally a reconditioned bearing will consist of a combination of remachined components of the original bearing and new components to give the correct clearances.

Reconditioning is generally more economical than manufacture of new bearings, depending upon the amount of work required to the subject bearing, for the following bearings:

- 01 Series: 320mm/13" bore size and over
 - 02 Series: 320mm/13" bore size and over
 - 03 Series: 160mm/6½" bore size and over
 - 04 Series: all sizes
- Thrust bearings: all sizes

Cooper are also able to recondition radial and thrust cylindrical bearings of non-Cooper manufacture.

FAILURE ANALYSIS

Cooper offer a failure analysis service for all sizes of bearing, of any age. Where appropriate, we will offer advice on fitting practices, lubrication regime, or modifications to the mounting arrangements to help improve future bearing life. Bearings sent for analysis may be reconditioned, recycled or returned as appropriate. Please inform Cooper if you wish to use this service, before returning bearings to one of our sites. A small charge may be made depending on requirements.

RECYCLING

The materials used in a Cooper bearing unit are almost completely recyclable. The diagram below helps to identify the various materials used in standard and popular optional versions of Cooper bearings so that they can be segregated as required.

OUTER HOUSING

Grey iron or ductile iron as standard.
Cast steel housings will usually have the letter 'S' inserted into their reference compared to the standard units listed in this catalogue (e.g. "PS07" instead of "P07" or "FS07" instead of "F07").
Fabricated housings are usually mild steel

SPECIAL FEATURES

Suffix characters may be used to indicate special features. Examples include:

BEARING FEATURES	
C2/C3/C5	Special clearances
AF	Axial float. This is preceded by the amount of axial float, e.g.: 2mm AF
AL(D)F	Aluminium cage with (double) flange (usually race riding)
AP	Air / grease purge points
CHAM	Special chamfer to inner race bore. This is followed by size of chamfer, e.g. (to indicate 7mm x 45° chamfer): CHAM 7
EXILOG	Bearing with fixed type outer race and floating inner race
FR	Full complement of rollers (no cage)
GM	Gunmetal / brass / bronze cage
GM(D)F	Gunmetal / brass / bronze cage with (double) flange (usually race riding)
GROSL	Single lipped outer race
OSO	Outer race set out (particularly for large bearings where outer race is usually retained in housing by radial screws)
XJR	Joint relief (to allow inner race to be mounted in recess)
ZN	Zinc alloy cage

CARTRIDGE FEATURES	
BOBP	Bolt-on blanking plate
BOBT	Bolt-on blanking plate with thrust bearing
BP/BT/BPTL/BTTL	See page 12
IH	Inspection hole (for measuring position of inner race of expansion bearings once assembled)
OB	Overbore (cartridge end bore is larger than bearing bore) This is followed by end bore size, using same format as bearing bore reference, e.g.: OB 207 or OB 65M (or OB 65mm)
TE	Drilled for temperature indicator element
OIL LUB	Oil lubricated

A letter may succeed the 'C' in the cartridge designation to indicate that the cartridge is made from non-standard material. Taking the examples of 01 C 60M and 01 C 03 as examples:

01 CN 60M and 01 CN 03 would indicate nodular (ductile) iron.
01 CS 60M and 01 CS 03 would indicate steel.
01 CA 60M and 01 CA 03 would indicate aluminium.

OUTER HOUSING FEATURES	
BEM	Base ends machined. This may be followed by machined length, e.g.: BEM 500mm
SI	Reduced swivel clearance between outer housing and cartridge
SLUB	Lubrication to spherical seat

For outer housings made in material other than standard, letters are interposed between the letter(s) designating the housing type (e.g. 'P' for pedestal, 'F' for flange or 'RET' for rod-end T-type) and the size designation. Taking the example of a P06 pedestal:

PN06 indicates a P06 in nodular (ductile) iron
PS06 indicates a P06 in steel
PA06 indicates a P06 in aluminium

Ductile iron and steel versions of an RET06 would be designated RETN06 and RETS06 respectively.

Numbers may be suffixed to bearing, cartridge or outer housing designations indicating a combination of special features or parts to special dimensions.

SPLIT ROLLER BEARING APPLICATIONS

The following pages show Cooper Split Roller Bearings "in action" across a range of industries and applications.

The examples shown underline the key advantages in terms of ease of installation, inspection and replacement, as well as graphically illustrating the superior efficiency of the Cooper sealing solution in even the most adverse environments.

MINING EXCELLENCE

Underground or surface, Cooper bearings make mining more profitable and are used on key applications across the industry. From material handling through hauling, screening and stockpile management, Cooper split bearings have long been recognized as a benchmark for reliability.

MINE WINDERS

1. Coal industry mine winders include 03 Series 600mm for an operating load of 80 tonnes per bearing at 48 rpm and 02 Series 400mm for an operating load of 32 tonnes per bearing at 31 rpm.

2. A 700mm diameter special double bearing supplied for a tower mounted winder in a copper mine. Normal operating load is 185 tonnes and the speed is 54 rpm.

3. STACKER RECLAIMERS

This bucket wheel stacker reclaimer can handle 3,500 tons per hour and the boom can operate on a pile up to 50 feet high. The slewing ring pinion gear is supported by 6½ inch and 7 inch 01 Series Cooper bearing in flange housings.

Cooper Bearings up to 380mm in diameter are used on the shaft of the bucket wheel as shown.

SUGAR PRODUCTION

The Cooper value proposition is universally recognised by both cane and beet sugar manufacturers and is used across a range of demanding applications from cane knives to conveyors, fans and blowers etc. Besides the savings in downtime from the split bearing, the Cooper sealing solution is the ideal defence against the abrasive effects of “bagasse” and other contaminants.

1. CANE KNIVES AND CRUSHERS

This cane knife machine is fitted with 03 BCP 200mm EX (Expansion) and GR (Fixed) bearings.

2. SCROLL CONVEYOR

Cleanliness requirements during the final stage of transporting white sugar to the bagging area demanded the use of custom-built 100mm stainless steel hanger unit.

MARINE SOLUTIONS

Cooper bearings have long-standing expertise in supplying both the commercial and military fleets of the world and are installed on a variety of vessel types from water-jet and z-drive driven passenger, cargo and support vessels to powered-from-amidships minesweepers.

Cooper offers an extensive range of split cylindrical and taper roller bearings in a variety of housing materials including aluminium and stainless steel. Application expertise gained over the years results in a range of “customized” options including jacking screws for easy alignment and spherical cartridge lubrication to counter hull flexing.

1. This Offshore Supply Vessel is fitted with Cooper 01 BCP 500 EX and 02 BCP 500 GR on the propulsion shaft.

2. A typical installation of a Cooper BCP on a propulsion shafting application.

3. Hoverspeed Super SeaCat is fitted with weight saving aluminium 01 BCAPLA 210mm EX cartridges and pedestals.

4. A typical waterjet drive trapped position utilising a 240mm BCP EX with felt seals.

POWER GENERATION CONVENTIONAL

Cooper split roller bearings support the power generation industry in both conventional and renewable segments across a wide range of key applications such as fans and blowers, conveyors, motors and generators etc.

Our experience and technology means many of our solutions can be “Made to Order” to suit the individual conditions and requirements.

1. CONVEYORS

The roles of conveyors include the transport of fuels (ranging from coal to organic wastes) and raw materials such as limestone for scrubbing. They remove waste products from both nuclear and conventional processes. You will find Cooper bearings assuring the smooth running of belt feeder, screw and other conveyors in power plants all over the world, in the harshest conditions and especially in ‘trapped’ locations where no other type of bearing can easily be installed or inspected.

3. PUMPS AND PUMP DRIVES

Hardworking bearings support vital pumping activities, feeding boilers, circulating cooling fluids and extracting condensates. Cooper bearings find application on a wide range of pump shafts, many in hard-to-access situations.

2. FANS AND BLOWERS

Fans play an important role in regulating temperature, removing dust, maintaining ventilation and scrubbing flue gases, often in harsh or corrosive conditions. Bearing locations are often trapped, with the result that split-to-the-shaft Cooper products offer distinct advantages in terms of accessibility.

POWER GENERATION RENEWABLE

1. HYDRO TURBINES

02 BCF 2500 EX fitted to a Hydro Turbine vertical shaft. The customer chose Cooper for ease of installation and inspection. The elimination of oil lubrication was also a bonus for the customer as they could comply with environmental legislation.

2. 01 BCF 380mm fitted to a vertical shaft water turbine.

01 BCF 380mm EX was selected in conjunction with the OEM on this 11,000kW vertical shaft ‘Kaplan’ turbine. Cooper was chosen for simplified installation, and uncomplicated inspection & maintenance

3. WIND TURBINES

Housing manufactured at our foundry for 1250mm bearing for a wind turbine test rig. The Cooper solution offered significant advantages over hydrodynamic/plain bearings in terms of requirements for shaft tolerance. At the same time significant power savings are achieved on start up and the risk of loss of lubricant film due to power failure is eliminated avoiding potential damage to the shaft.

STEEL EXPERTISE

Specialists in steel for decades, Cooper Bearings offer optimum performance, simple and speedy bearing inspection for preventative maintenance and immense downtime savings during inspection or replacement.

1. CONTINUOUS SLAB CASTER BEARINGS

Cooper is renowned with steel end users and OEM customers around the world for their expertise and experience in producing bearings and water-cooled housings for this most demanding of applications.

2. LINK SPINDLES

A Cooper 01 B 560mm on a link spindle drive to a high speed reversing (78rpm in 2 seconds) rolling mill. The use of 01 Series bearings, double mounted in one specially manufactured housing provided the required load capacity while meeting the high speed reversal speed requirements.

3. PILGER MILLS

The Cooper brand has long been synonymous with longer bearing life in this most demanding of applications and is the bearing of choice for OE manufacturers and tube makers.

With a range from 125mm to 500mm bore, Cooper split bearings are used across the world for the manufacture of pilgered tube in copper, stainless steel and titanium.

4. COOLING BEDS

Cooling beds are an application which perfectly illustrates the advantages in maintenance and downtime savings in trapped applications as well as the efficiency of the superior Cooper sealing solution.

Cooling bed drive mechanism utilising 200mm 01 Series BCP units.

CEMENT/AGGREGATES ROBUST SOLUTIONS

Cooper Bearings are proven to operate effectively in hostile and abrasive conditions across a range of applications in the cement and quarrying industries.

1. CLINKER BREAKERS

Detail of cement works clinker breaker showing a Cooper 03 BCP 180mm GR. This machine also uses 03 BCP 180mm EX Expansion bearings.

2. BALL MILLS

01 BCP 1016mm EXILOG GR fitted to a 10 feet diameter Silica Mill.

3. BALL MILLS

Lichtenberg Lafarge use Cooper 03BCP 320mm on this ball mill.

In addition to these illustrations and numerous UK applications, Cooper bearings are also used on ball mills in: Egypt, Greece, Ireland, USA and Turkey.

Sizes range from 01 BCP 300mm EX and GR to 01 BCP 950mm EXILOG GR

4. SCREW CONVEYORS

This Kaolin screw conveyor is fitted with 01 BH 60mm EX bearing and uses automatic lubrication. The hanger bearing has a double heavy duty lip seal to retain the lubrication and keep out the Kaolin

CEMENT/AGGREGATES ROBUST SOLUTIONS

5. FANS

This lubricator equipped cement industry fan is fitted with an 02 BCP 8" EXTL.

6. FANS

Cooper 01 Series BCP on a Canadian lumber drying kiln.

7. FANS

This cement works ventilation fan uses Cooper 02 BCP 900 EX TL SI and 02 BCP 900 GR TL SI.

8. CEMENT KILN

Cement kiln using 10 inch 03 Series with roller thrust bearings in the cartridge end plates which support the under rollers on the kiln. The radial load is 28 tons, the axial load 10 tons and the speed is 4-5rpm.

9. BUCKET ELEVATORS

This German bucket elevator uses Cooper 01 BCP 160mm GR in trapped positions. The advantages of Cooper split to the shaft bearings are easily seen in these pictures.

10. BELT CONVEYORS

Take up housings (Tension Type) with Cooper 01E 80mm EX (Expansion) and GR (Fixed) bearings fitted to a raw materials conveyor at an aggregate depot.

11. BELT CONVEYORS

A German chalk extraction conveyor operates in dusty, dirty and moist conditions which caused the motor and gearbox to be firmly stuck to the shaft. The main conveyor bearing failed requiring immediate replacement.

The existing 150mm bearing was replaced with a Cooper 01 BCP 150mm GR SRS. The split rubber seal was specified to combat the moist environmental conditions.

12. BELT CONVEYORS

Water collected in the tail drum pit entered the bearings. As a result, the SNL 515 - 612 bearing fitted to the 100mm shaft failed every 2 to 3 months.

Cooper recommended a BCP 100mm GR (Fixed) and EX (Expansion) bearing equipped with the Cooper SRS seal to solve the problem of water penetration. The SRS seal is available in high and low temperature versions (-20°C to 100°C).

MISCELLANEOUS APPLICATIONS

PAPER

Trapped 01E BCP 315 EX ATL and 01 BCP 415 EX ATL bearings are shown in use on agitators in the paper industry.

GRAIN

The previously fitted SF75/1075/75 bearings used on this 600 staggered bucket elevator had the 75mm, 106RPM drive shaft bearings fitted in trapped applications behind a 13-1 reduction gearbox which caused immense maintenance access problems.

In order to reduce the customer maintenance expense, Cooper recommended 01E BCDFN 75mm EX (Expansion) and GR (Fixed) bearings.

ASPHALT

This application is a conversion from a solid pillow block unit to a split to the shaft 01E 65mm GR Cooper SN compatible pedestal. For trapped applications such as this Cooper split bearings are the ideal solution.

AUTOMOTIVE

The UK General Motors paint shop uses Cooper 01E BCP 75mm EX and GR bearings for fume extraction bearings.

BESPOKE SOLUTIONS

Cooper has a long and proud tradition of manufacturing "Made to Measure" solutions for individual customer requirements. Our facility for customising encompasses both bearing and housing both of which are manufactured in our factory. The following examples are merely a selection of the kind of configurations which we are pleased to do for continuing customer satisfaction.

1. SCROLL CONVEYORS

Picture A shows a plain bearing on a scroll conveyor at a French sugar plant where short bearing life, shaft wear and product contamination from oil and rust were causing major problems.

The custom-built Cooper solution in picture B combined a triple boss hanger mounting with split roller bearing equipped with double sealing and air purge provision on each end.

2. MIXERS

Twin-screw mixer for processing Ammonia Nitrate for fertilizer. Due to both cost and the toxic environment the user wanted to reduce changeover time to an absolute minimum.

The use of a special tandem unit comprising a double pedestal housing with 02 BCP 60mm EX/GR bearings with special extended HTP seals reduced change time considerably with a saving of £4500 per outage.

BESPOKE SOLUTIONS

3. MARINE “Z-LINE” UNITS

The image shows a Cooper Pedestal unit mounted by a Spanish coupling manufacturer on a composite propulsion shaft. The pedestal base is solid to enable mounting in “Chock-fast”® on the vessel.

The housing is drilled to enable mounting of a temperature sensor and a spherical lubrication point added to assist alignment when the ship's hull flexes during operation.

4. SPLIT TAPERED ROLLER BEARINGS

In recent years Cooper expertise and split bearing technology has seen the expansion of our product offering to include a range of split tapered roller bearings examples of which are shown below.

Cooper double row 780mm bore split tapered roller bearing on a link-spindle for a steel making plant.

Cooper tapered roller bearing for marine Z-drive propulsion for intermittent thrust loading.
