

NTN-SNR LINEAR MOTION: **BALL BUSHINGS**

www.ntn-snr.com

With You

As one of the leading manufacturers of rolling bearings in Europe, NTN-SNR has been, for many years, among the most innovative companies within its sector of industry. Since April of 2008, SNR has been a part of a corporate group together with the Japanese company NTN, making it the third largest manufacturer of rolling bearings in the world. Hence, we are able to offer “added value” to our customers with reference to product variety, quality and service. Our company is clearly identified through a world-wide presence and through its continuous quality system. Since 1985, we are also active in the market of linear technics. Our extensive line of products within linear technics, our know-how and our made-to-measure services have made us renowned with our customers as a highly efficient partner. It does not matter if for instance it concerns machine components such as ball screws, the attached fixed – and floating bearing units, ball bushings and shafts, or whether you require a linear module as a single-axis or a multi-axes system. NTN-SNR offers you

specific and individual customer solution concepts. The NTN-SNR delivery program for ball bushings, shafts and shaft supports offers an extensive variety of DIN ball bearings, as well as models that are completely different. The program is completed by full bearing units including the casing or shaft toolings according to individual customer orders. By way of our wide product program, you will surely be able to find a suitable solution for your application(s). We also provide support with reference to the development of system solutions. Our extensive network of sales and technical engineers will offer you individual advice on-site and they will provide you with specific solutions for your individual application(s).

This technical catalog is the foundation for a meaningful dialogue with you.

We look forward to receiving your order –
We are most happy to welcome you as our customer!

ISO dimensions

Standard ball bushings, closed

The closed ball bushings of the BBE series according to ISO 10285 are widely utilized in various applications because of their precise cylindrical shape and good operational qualities.

The standard ball bushings can be supplied from stock, with two wiper seals. The required seals are to be included when ordering.

Optional relubricable

Examples of order reference for a ball bushings with single-sided seal: BBE12U, BBE12AU

Examples of order reference for a ball bushings with double-sided seal: BBE12UU, BBE12AUU

Examples of order reference for a ball bushings with double-sided seal, relubricable: BBE12UU-RL

4,15	116	6	-20			9 456	16 000	5 140	BBE80	-	-

The indicated load ratings are applicable in case the load only applies to one row of balls. If, however, the force is shared between two rows of balls, the load capacity is increased (refer to table on page 75).

Standard ball bushings, open

Where bending (deflection) of the shaft has to be avoided, open standard ball bushings are utilized in combination with shaft supports. This is often the case for applications with extended travel. By way of the combination described above, the stiffness is in fact additionally increased.

The standard ball bushings can be supplied from stock, with two wiper seals. The required seals are to be included when ordering.

Optional relubricable

Examples of order reference for a ball bushings with single-sided seal: BBE12U-OP, BBE12AU-OP

Examples of order reference for a ball bushings with double-sided seal: BBE12UU-OP, BBE12AUU-OP

Examples of order reference for a ball bushings with double-sided seal, relubricable: BBE12UU-OP-RL

The indicated load ratings for open ball bushings are only applicable where the load is applied from above; if the load is applied from the "open direction", the load capacity is reduced by the following factor (refer to table on page 75).

Standard ball bushings, adjustable

The slotted standard ball bushings can be built into a casing with an adjustable internal diameter, allowing the clearance between the shaft and the ball bearing to be set.

The standard ball bushings can be supplied from stock, with two wiper seals. The required seals are to be included when ordering.

Optional relubricable

The indicated load ratings are applicable in case the load only applies to one row of balls. If, however, the force is shared between two rows of balls, the load capacity is increased by the following factor (refer to table on page 75).

Standard flanged ball bushings (round)

Flanged ball bushings of the BBER series represent a useful addition to the standard ball bushings.

They offer the following advantages:

- The integrated flange design enables a more efficient arrangement of the housing or mounting holes.
- The flanged ball bushings are economical, because fewer components are required and altogether the installation is easier.
- The replacement of the ball bushings is easier.

The standard ball bushings can be supplied from stock, with two wiper seals. The required seals are to be included when ordering.

Optional relubricable

Examples of order reference for a ball bushings with single-sided seal: BBER12U, BBER12AU

Examples of order reference for a ball bushings with double-sided seal: BBER12UU, BBER12AUU

Examples of order reference for a ball bushings with double-sided seal, relubricable: BBER12UU-RL

The indicated load ratings are applicable in cases where the load only applies to one row of balls. If, however, the force is shared between two rows of balls, the load capacity is increased by the following factor (refer to table on page 73).

Tandem standard ball bushings

The tandem standard ball bushings of the BBE...L series have the same dimensions and tolerances of the ISO standard ball bushings, however they are twice as long and they are applied where high moment load exists.

The big advantage of this type of ball bushings is that two standard ball bushings may be replaced. Since the concentricity is built in, increased accuracy is achieved and manufacturing costs reduced.

The standard ball bushings can be supplied from stock, with two wiper seals. The required seals are to be included when ordering.

Optional relubricable

The indicated load ratings are only applicable in cases where the load is being applied to a single row of balls bearing. If, however, the force is shared between two rows of balls, the load capacity is increased by the following factor (refer to table on page 75).

Tandem flanged standard ball bushings (round)

The ball bushings of the BBER...L series combine the advantages of flanged standard ball bushings with those of tandem ball bushings, since they provide a rigid, aligned linear guidance through their length, allowing the application of a second ball bearing.

The standard ball bushings can be supplied from stock, with two wiper seals.

The required seals are to be included when ordering.

Optional relubricable

Examples of order reference for a ball bushings with single-sided seal: BBER12LU, BBER12LAU

Examples of order reference for a ball bushings with double-sided seal: BBER12LUU, BBER12LAUU

Examples of order reference for a ball bushings with double-sided seal, relubricable: BBER12LUU-RL

The indicated load ratings are only applicable in cases where the load is being applied to a single row of balls. If, however, the force is shared between two rows of balls, the load capacity is increased by the following factor (refer to table on page 75).

Super ball bushings (closed, open)

The super ball bushings of the BBET series according to ISO 10285 are available as an open and a closed model. The super ball bushings have similar dimensions and tolerances as standard ball bushings.

Super ball bushings have crowned track segments which allow misalignments of up to 0.5° to be accommodated. Hence, overloading because of bending (deflection) of the shaft or skew due to inaccuracies of the tooling hole is avoided.

Through the specific construction, higher capacities, smoother operation, as well as a higher permissible operating speed of up to 3 m/s, are obtained.

Because of the self-adjustment, per shaft, at least two super ball bushings should be utilized to avoid tilting.

The super ball bushings can be supplied from stock, with two wiper seals.

Examples of order reference for a ball bushings with double-sided seal: BBET12UU, BBET12UU-OP

The indicated load ratings are only applicable in cases where the load is being applied to a single row of balls. If, however, the force is shared between two rows of balls, the load capacity is increased by the following factor (refer to table on page 75).

Ball sleeves

The ball sleeves of the KH series are compact linear ball bearings with small dimensions similar to sleeve bearings.

The balls, circulating in the retainer pass via openings in the outer sleeve, allowing relubrication.

The ball sleeves with the order reference printed in **bold** are also available with two wiper seals. The required seals are to be included when ordering.

Example of order reference for a ball bearing with double-sided seal: **KH1228LL/3AS**

Linear units with standard ball bushings, relubrication

Linear units with standard ball bushings, closed casing

Due to their optimised design, the linear units of the LSE series with a relubrication system offer high precision in any type of installation.

A LSE linear unit consists of the following:

- casing (AlMgSi0,5)
- BBE standard ball bushings
- wiper seals made from NBR

The linear units offer substantial cost advantages to the user, because of reduced construction expense.

The unit construction allows easier integration into installations. Reduced unit weight is obtained by using high grade aluminium, allowing for greater accelerations and higher speeds.

Linear units with standard ball bushings, closed casing and adjustable clearance

The LSE...-AJ series of linear units are used where guidance with pretension or without play is required.
An adjusting screw allows the radial clearance to be set.

A LSE...-AJ linear unit consists of the following:

- casing (AlMgSi0,5)
- BBE...-AJ standard ball bushings
- wiper seals made from NBR

Linear units with standard ball bushings, casing at one side

Normally, with the open ball bushings design, if the load is applied against the 'open direction', substantial reductions in the load capacity occur.

The linear units of the LSE...-SOP series are designed to handle forces in all directions, without a reduction in the load capacity.

A LSE...-SOP linear unit consists of the following:

- casing (AlMgSi0,5)
- BBE...-OP standard ball bushings
- wiper seals made from NBR

Order reference	Dimensions [mm]

Linear units with super ball bushings, relubrication

Linear units with super ball bushings, closed casing

Due to their design, the linear units of the LSET series with a relubrication system offer high precision in any type of installation.

A LSET linear unit consists of the following:

- casing (AlMgSi0,5)
- BBET super ball bushings
- wiper seals made from NBR

The linear units offer substantial cost advantages to the user, because of reduced construction expenses.

The unit construction allows easier integration into installations. Reduced unit weight is obtained by using high grade aluminium, allowing for greater acceleration and higher speeds.

Linear units with super ball bushings, open casing

The linear units of the LSET...-OP series with the re-lubricating option are used on long shafts which are fully supported. They offer a high level of rigidity and handle loads in all directions. The unit design allows for simpler integration into the installations.

A LSET...-OP linear unit consists of the following:

- casing (AlMgSi0,5)
- a BBET...-OP super ball bushings
- wiper seals made from NBR

Linear units with super ball bushings, open casing and adjustable clearance

The linear units of the LSET...-AO series are used where guidance with pretension or with play is required, Radial clearance can be set by means of an adjusting screw,

A LSET...-AO linear unit consists of the following:

- casing (AlMgSi0,5)
- a BBET...-OP super ball bushings
- wiper seals made from NBR

Support rail

Without flange

For supporting shafts in applications utilizing open ball bushings, shaft supports made of an aluminium alloy are available.

The shaft supports without 'SR' flange are suitable for constructions in which the shaft can be mounted from below.

For continuous support, the shaft supports can be installed one behind the other. It is possible to shorten them to the required length, if only partial support is required.

Order reference	Dimensions [mm]												Weight in case of max. length [g]

Traverse

For the quadro-linear units of the LSEQ and LSEQ...-OP series, tandem-shaft blocks are available in two models.

Model A is utilized where the shaft blocks are fixed and the linear blocks moving.

Model B enables moving of the shaft, with the linear unit fixed.

Shaft tooling

Addition tooling (eg. taps, internal and external threads, countersinks) which require annealing may display minor dimensional changes.

Length tolerance for shortened shafts

Shaft length L [mm]		Max. tolerance [mm]
from	to	
-	400	±0,5
400	1000	±0,8
1000	2000	±1,2
2000	4000	±2,0
4000	6000	±3,0

Combination 00 standard order

After cutting, the shafts are only shortened and deburred, no further dressing of the end is carried out.

Combination 01 standard stage

The shafts are chamfered on both ends after the shortening, preventing the occurrence of damage to the ball cage or seals, in case of contact with the ball bushings.

Ød [mm]	4	5	6	8	10	12	16	20	25	30	35	40	50	60
l1 [mm]	1	1,5	1,5	1,5	1,5	2	2	2	2	2	2	3	3	3

Combination 02 axial thread

General information

Introduction

Linear ball bushings achieve longitudinal movement along a shaft by retaining the balls in a closed circulation path, allowing constant recirculation through the load zone. Hence, unlimited lifting heights/strokes are possible. The ball bushings offer the advantages of any journal (ball) bearing, namely a long operational life, low friction and breakaway torque, high precision and efficiency. The surfaces of the bearings are made from high-grade rolling bearing steel. The precisely shaped and polished cylindrical sheet-metal outer ring consists of one single part. It is held together by way of turned parts, screwed into the bushing/case and combining the function of smooth sealing rings through their design. Therefore, standard bearings with wiper seals can often be utilized. A unit with high rigidity, functional reliability and sustainability is achieved.

Load ratings

Dynamic load rating C

The radial load with constant magnitude and direction, a linear-rolling bearing can theoretically cope with for a nominal operational period of 10^5 m covered distance. Remark: The details of the dynamic load rating stipulate that the lift of the linear-joint (ball) bearings should be at least three times its overall constructional length.

Static load rating C_0

Static radial load results in deformation at the contact zones with the highest load/stress between the rolling element and the orbital path (shaft) of 5300 Mpa.

Remark: The permanent overall deformation of the rolling element and the orbital path corresponds approximately to a factor of 0,0001 of the diameter of the rolling element.

Permissible load

Comparison between permissible loads in standard ball bushings and tandem models

Type	dynamic load rating	static load rating	permissible static moment
BBE...*	1	1	1
BBE...L	1,6	2	~ 6

* for comparative purposes, standard type BBE is set as "1".

Closed and adjustable ball bushings

Number of rows of balls	4	5	6
C (load rating according to Table)			
C_{MAX} (maximal load capacity)			
Load coefficient C_{MAX}/C	1,414	1,463	1,280

The load capacity of a ball bearing (closed and adjustable) varies depending on the reference point of the load (and) on the circumference (size). The value in the Tables indicates the smallest load rating assuming a load working from/on the topside of a ball element. Where two ball elements are utilized that are being evenly loaded, the value increases. The Table above displays the values for the number of ball elements in each of the cases.

Open ball bushings

Number of rows of balls	3*	4	5
Load from above			
Load from below			

* except the types with three rows, with a steel cage.

Where a load is applied in the open direction, the load capacity (rating) is reduced, because the load is working on a smaller number of rows of balls.

Material

Depending on the application, various models of ball bushings may be utilized.

Standard ball bushings of the BBE series consist of the following:

- a hardened and polished outer sleeve (100Cr6)
- a guidance cage made from plastic (POM)
- balls made from ball-bearing steel (100Cr6)
- wiper seals made from NBR (optional)

These ball bushings have as distinctive advantages for instance reduced noise during operation and a cost-efficient model.

Standard ball bushings of the BBE...A series consist of the following:

- a hardened and polished outer sleeve (100Cr6)
- a guidance cage made from austenitic stainless steel (X2CrNi 18-9)
- balls made from ball-bearing steel (100Cr6)
- wiper seals made from NBR (optional)

Potential applications: high temperatures, for instance in foundry applications or applications involving vacuum, where the utilization of plastic parts is not feasible.

The corrosion-resistant ball bushings of the BBES series consist of the following:

- a hardened and polished outer sleeve made from martensitic stainless steel (X105CrMo17)
- a guidance cage made from plastic (POM)
- balls made from ball-bearing steel (100Cr6)
- wiper seals made from NBR (optional)

Potential applications: corrosive environments.

The corrosion-resistant ball bushings of the BBES...A series consist of the following:

- a hardened and polished outer sleeve made from martensitic stainless steel (X105CrMo17)
- a guidance cage made from austenitic stainless steel (X2CrNi 18-9)
- balls made from ball-bearing steel (100Cr6)
- wiper seals made from NBR (optional)

The ball bushings of the BBES...A series are specifically intended for use under extremely dirty conditions, for instance cement works or the wood processing industry. A further potential area of application is the industry in which aggressive cleaning agents are used (e.g. the food industry, chemical industry, pharmaceutical and medicinal industry).

Super ball bushings of the BBET... series consist of the following:

- a guidance cage and outer sleeve made from POM
- hardened steel inserts with polished orbital path groove (15CrMo5)
- balls made from ball-bearing steel (100Cr6)
- wiper seals made from NBR (optional)

The high-grade super ball bushings of the BBET series distinguish themselves from the conventional ball bushings by a triple load capacity and by an operational life that is 27 times as long as the normal one.

The ball bushings of the KH... series consist of the following:

- a hardened sleeve, shaped without cutting (chipless)
- a guidance cage made from plastic (POM)
- balls made from ball-bearing steel (100Cr6)
- wiper seals made from NBR (optional)

Ambient temperature during operation

Material		Name	Temperature range
Outer sleeve	Cage		
Steel	Plastic	BBE...	-20°C ~ 80°C (-4°F ~ 176°F)
	Steel	BBE...A	-20°C ~ 110°C (-4°F ~ 230°F)
Stainless steel	Plastic	BBES...	-20°C ~ 80°C (-4°F ~ 176°F)
	Steel	BBES...A	-20°C ~ 140°C (-4°F ~ 284°F)*

*When using a ball bearing with seals, the ambient temperature should not exceed 120°C (248°F).

Service life

Nominal service life

The nominal service assumes a 90% certainty for achievable service life for a single rolling bearing or a group consisting of similar rolling bearings, running under the same conditions, with standard material of normal production quality and under standard operating conditions.

The sizing of the ball bearing is determined by the required service life and load. The service life of the ball bushings is calculated in the same manner as all rolling bearing, using the following formula:

$$L = \frac{C}{F} \cdot \frac{f_h \cdot f_T \cdot f_c}{f_w} \cdot 50$$

$$L_h = \frac{L}{2 \cdot s \cdot n_s \cdot 60}$$

L nominal service life, km

C dynamic load rating, N

F dynamic load, N

f_h hardness factor of the shaft hardness (standard 1)

f_T temperature factor

f_c contact factor

f_w load factor

L_h nominal service life, h

s stroke length, m

n_s stroke frequency, min⁻¹

Hardness factor for shaft hardness f_h

If shafts are utilized with a hardness of the surfaces of less than 60 HRC, a hardness factor is to be taken into account.

Temperature factor f_t

If the ambient temperature of the ball bushings exceeds 100°C (212°F) during operation, negative effects from the high temperatures must be taken into account. Moreover, the respective ball bearing has to be suited for high temperature ranges.

Contact factor f_c

If multiple ball bushings are put closely together, the running motion is influenced by moments and the mounting precision, in such a way that an equal load distribution is very hard to achieve. In such a case, a contact factor is to be taken into account.

Number of ball bushings closely put together	f_c
1	1,0
2	0,81
3	0,72
4	0,66
5	0,61

Load factor f_w

In general, machines with oscillating movements cause vibrations and shocks during their operation. Generally, it is quite hard to exactly determine the vibrations and shock loads, caused by repeated starting and stopping, during operation at high speeds. If the loads acting on the ball bushings cannot be measured or in case of high speed and shock loads having a large influence, the appropriate load factor has to be applied.

Operating conditions, speed V	f_w
Normal operating conditions, $V \leq 0,25$ m/s	1,0...1,5
Normal operating conditions with limited vibrations/shocks, $0,25 < V \leq 1,0$ m/s	1,5...2,0
Operating conditions with strong vibrations/shocks, $V > 2,0$ m/s	2,0...3,5

Static safety coefficient f_s

The static safety factor is used to prevent unacceptable permanent deflections of the raceways and rolling elements. It is the relation between the static load capacity rating C_0 and the maximum occurring load F_{0max} . The maximum load condition including transient conditions is assumed.

$$f_s = \frac{C_0}{F_{0MAX}}$$

f_s static safety coefficient
 C_0 static load rating, N
 F_{0max} maximum static load, N

References for the static safety coefficient in case of various operating conditions:

Operating conditions	f_s
Normal operating conditions	1 ... 2
Limited shock loads and vibrations	2 ... 4
Moderate shock loads or vibrations	3 ... 5
Strong shock loads or vibrations	4 ... 6
Load parameters are unknown	6 ... 15

Lubrication and friction

The friction levels for ball bushings without wiper seals are quite low, at approx 0.001 to 0.003. The general rolling bearing criteria apply to the lubrication. Lubrication can be mineral based oil or grease and the following is to be taken into account. The grease enhances the sealing and adheres to the ball bearing. Further lubrication is only necessary over longer intervals. Contrary to ball screws and track rail guides, substantially less lubricant is required for ball bushing guides, due to the limited contact surface between the rolling bearing and the orbital path.

We recommend mineral based grease of K2K DIN 51825 quality. In case of loads that are more than 10% higher than the dynamic load capacity rating, greases with EP additives are to be used (KP2K DIN 51825). The ball bushings as standard are treated and delivered with an oily preservative. The preservative can be used with and can be combined with lubricants having an oily basis, so that in general the bearing does not have to be washed before installation.

Under normal circumstances, grease SNR LUB EP is used. Specific requirements under certain environmental conditions require the use of suitable grease. In vacuum applications, lubricants are required that have a lower evaporation rate, in order to keep the vacuum atmosphere in good order. In the food industry and cleaning room, there are special requirements for the lubricant with regard to emission and compatibility. Basically the compatibility of the lubricants in relation to each other should be checked. In case of special ambient conditions, we will gladly assist you.

Klübersynth UH1 14-151	sythetic ‘KW’ oil / ester oil / aluminium - complex soap	1	310...340	apx. 150	920	-45...+120	- good corrosion protection - good durability - high water resistance - NSF H1 registered*	- Pharmaceu- tical industry - Food industry

* This grease is registered as H1 product: it has been developed for occasional, technically unavoidable contact with foodstuff. Experiences have shown that the grease can also be used for the corresponding applications in the pharmaceutical and cosmetic industry, on the conditions listed in the product information. However, there are no specific test results, for instance, on the biocompatibility, as may be required under certain circumstances in the pharmaceutical area. Therefore, before it is used in this area by equipment manufacturers and distributors, corresponding risk analyses must be performed. If necessary, measures to avoid health hazard and injuries must be taken. (Source: Klüber Lubrication).

In case of the initial lubrication and further lubrication through the lubricating hole, lubricant has to be applied to the bearing in installed shafts until it abundantly 'fills' the bearing.

The lubrication period depends on many influential factors, for instance:

- Load
- Speed
- Motion sequence
- Temperature

The following influential factors reduce the lubrication interval:

- Greater load
- High speed
- Short stroke (stroke is shorter than three times the length of the ball bearing)
- Lower ageing resistance of the lubricant

Precise lubrication intervals can be obtained upon request, based on the operating conditions.

Fittings

In general, in case of standard ball bushings, the normal clearance fit is applied. The transition fit is used, in order to reduce the play and increase the accuracy.

The pre-tension for the adjustable and open ball bushings must be set according to the values displayed in the table for the radial play (clearance), so that the allowable limit values for the pre-tension cannot be exceeded.

In case of the super ball bushings, it has to be taken into account that adequate play (clearance) occurs between the super ball bearing and the shaft. If that is not the case, early failure and/or jerky movements may be caused.

Series	Shaft		Casing	
	Clearance fit	Transition fit	Clearance fit	Transition fit
BBE...	h6	j6	H7	J7
BBE...L	h6	-	H7	-
BBER...	h6	j6	-	-
BBER...L	h6	-	-	-
BBET...	h6	-	H7	-

Standard ball bushings are otherwise inserted in a H7 bore and retained by way of locking rings. Alternatively, they can and may also be fixed or adhered by way of screwed disks, locking plates or washers.

Using complete bearing units in which the bearings have already been installed eliminates fitting concerns and offers a significant cost benefit.
